

First My basis

To evaluate the library fairness across all neighborhood i choose two column to be my basis and they are:member_id,member_total_checkouts

2.My finding

After searching i find that Shubra has the less amount od numbers and checkout by 5 members and 34 checkouts

Shubra: 5 members | 34 checkouts

3.The plausible reason

One of the possible reasons is that There might not be many advertisements for it in shubra or there might a large distance between shabra and library as another neighthoods as Zamalek for example

4.The next step

For the next year,the library can do many thing such as increasing advertisements in shubra And We might offer sales to Shubra people or open a branch there to increase demand.
